How to detect Glaucoma?

For General Practitioners only

Date: Tuesday 31\textsuperscript{st} March 2009

Time: 6.15pm – 8pm
Light refreshments on arrival

Venue: Campbelltown Eye Care,
Campbelltown Shopping Centre
608d Lower North East Rd., Campbelltown

Approximately 300,000 Australians have Glaucoma. Generally there are no warning signs associated with this eye condition. Treatment cannot recover what has been lost. That is why it is so important to detect the problem as early as possible, to be able to start treatment with as little damage to the vision as possible. GPs play an important role in prevention, early intervention and identifying patients at higher risk for glaucoma.

BUT

Do you know about some of the latest diagnostic tests and what role an optometrist can play to help?

The aim of this activity is to increase awareness of glaucoma screening and to demonstrate current technology for early detection of glaucoma.

By the end of the activity the participant will:

• Have increased awareness of the diagnostic pathways for the screening and early detection of glaucoma in patients who may be at risk.
• Have experienced a glaucoma assessment and conducted a laser polarimetry assessment under the guidance of an expert.
• Increase in confidence and motivation to implement a system to detect ocular disease in their patients who are at higher risk of glaucoma.

Please note places for this event are limited.
